

CableJoG cable testers now at DWR

DWR Distribution is delighted to supply CableJoG to the South African market. Based in the United Kingdom, CableJoG design, manufacture and distribute a range of cable testers from 12 test points in the case of the AudioJoG Pro audio cable tester and AudioJoG Rack through to 1024 in the CableJoG 512 cable tester with the extra 512 adaptor.

All cable testers have at least one memory option enabling rapid testing of similar cables.

All CableJoG's testers, except the RibbonJoG ribbon cable testers, test every pin against every other pin regardless which 'side' of the cable tester the cables are plugged into. This means that shorts across unconnected pins are automatically identified.

All testers check for continuity. The minimum resistance detected varies from model to model but, is always sufficient for a whole roll or reel of cable to be tested.

The RibbonJoG is the only end to end cable tester in the range as it is intended for testing only ribbon cables.

The AudioJoG cable testers are designed for the Audio Professional who needs to check a variety of audio leads. Using two AudioJoG cable testers it is possible to test the cable in situ without bringing the cable ends together into one unit. Testing is carried out from the local end, however the results can be seen at both ends.
