

DiGiCo delivers the power of the Stealth Core 2

Posted on July 14, 2016

DiGiCo is pleased to announce that Stealth Core 2, a major upgrade to the Stealth Digital Processing™ for its SD series digital mixers, is now available. Delivering significantly enhanced processing from the audio core of DiGiCo SD series consoles, Stealth Core 2 will take the range to a new level in terms of both processing channels and functionality.

Available as an upgrade option for existing users and shipping as standard on new consoles, Stealth Core2 has been updated from the ground up, with the application code upgraded to deliver significantly enhanced facilities. This will future-proof SD series consoles and continue to keep DiGiCo users one step ahead of the rest.

DiGiCo's new Stealth Core 2 engine has taken the SD range to the next level. Thanks to some smart developments in FPGA technology, the entire range is now quicker and more powerful, capable of even more processing channels. Not only does every SD console now benefit from expanded bussing and a greater palette of on-board effects, there's Dynamic EQ and a DiGiTube on every channel and buss, and thanks to a refined new-look application code, the whole user experience is instantly more satisfying. In short, Stealth Core 2 provides more flexibility and further functionality at a very attractive price point.
