

RES provides technical know-how to the ambitious 'Mexico dome' installation in London

UK – London-based creative technology expert Realtime Environment Systems Ltd (RES) has provided the media server know-how in collaboration with LM Productions and Mapp3D Producciones for a 'full dome' installation celebrating Mexican culture.

The temporary 25m white dome was constructed at Potter's Fields Park on London's Southbank for two weeks as part of the official 'Year of Mexico in the UK' celebrations. Inside, the Mexican Tourism Board pop-up featured a huge projection mapped dome, where images of the country's rich cultural and natural heritage swirled above

RES's Mark Calvert worked closely with LM Productions' Tim Kingsmill and Stephen Harvey to supply an Avolites Ai EX8 Pro 2 media server running the latest software – Ai V8 – which features the powerful new Autoblend feature. This feature uses a camera-based warp and blend tool set, allowing multiple projectors to blend images for projection.

"This was an ambitious project, using six Barco 20,000 Lumen projectors and the EX8 Ai server running the latest software tool set to drive the seamless visual content and blend it onto the inside of the large dome above the heads of visitors," says Calvert. "The projectors were positioned all the way around the periphery of the inside of the dome, cross-projecting to the opposite side of the dome to create a very large, single seamless image. We were very pleased LM Productions came to RES for the system purchase and we look forward to working with
