

Robe in Control for Kensington

Dutch rockers Kensington brought their hugely successful double platinum 'Control' album cycle to a close with a show-stopping performance for around 50,000 fans at Amsterdam ArenA.

Belgian based lighting designer Michiel Milbou of Never Fear Shadows was asked by technical and show production co-ordinators Bush Cherroud and Albert Deltour from Nexxt Technology to come on-board and create a light show fitting for the occasion ... and he spec'd over 200 Robe Spiiders and BMFL Spot moving lights to be at the core of an epic visual extravaganza.

Michiel worked closely with Jop Kuipers, the band's lightingoperator, set designer Ronald van den Bersselaar from BEE0 and graphic designer Mo Assem from Mr Beam, and together they devised the look and aesthetic of the show.

It was the first time that Michiel – well known for his flair and imagination in the television and live music sectors – has worked with the band. He was asked to take on the LD role, and was “delighted to be working alongside such a talented and innovative production team for one of The Netherlands' best-known bands”.

Michiel suggested assorted lighting proposals after acquainting himself with the music and set list. He wanted to keep it simple.

The band wanted a substantial upstage video screen, so he designed lighting with that in mind first and foremost. The video wall ended up being an impressive main 56-metre-wide section with two narrower strips of video running top and bottom at staggered depths.

It is a rock show through-and-through ... so that is also had to come across in the rhythm and style of the lighting. He was very keen to have some throw-backs to those classic big PAR can rock looks that graced

stages for iconic R 'n' R heroes like Queen and AC/DC back in the day – and Michiel, naturally, wanted to use this retro technology in a modern way.

Lighting supplier Phlipppo had four enormous custom manually operated follow spots made for the back of the stage, where they were positioned on the floor each featuring a 6x6 matrix of ACL bulbs.

Continuing the tungsten theme, Michiel had two large Svoboda-style frames made up of PAR 64s which were deployed each side of stage, just offstage from the set, for intense warm looking blinders blasting out into the crowds.

The 58 x Robe BMFL Spots were his primary effects lights.

“I wanted BMFLs because it’s a stadium, so I needed the brightest light source available, and the one that was the most versatile to keep everything moving! There was only one choice!”

That most of the show was in daylight was another factor. For curfew reasons they had to finish at 11 p.m. so the first half of the show saw plenty of natural lumens still flooding into the Arena.

So BMFL Spots provided those very special lightsources that impacted even with all that natural light *and* the LED wall in the space

BMFLs were rigged in four rows in between the primary LED screen and its four border banner strips – giving him two dynamic low volleys and two high ones ... of powerful, precise, eye-popping profiles.

The 129 x Spiiders were divided between the central 12-metre-wide performance area – above and below the screen elements for a big battery of powerful wash and beam fixtures immediately behind the band.

The rest were deployed on the floor and around the sides of the stage to cross light the band from a mid-stage location.

They were chosen again for their power and the excellent colour mixing in particular the white variants. Michiel used a lot of whites in the show ... the crisp accuracy of the Spiider’s daylight blues making a perfect contrast to the warm organic glow of the tungsten elements.

“They are an excellent light – I love them” stated Michiel, who first started using Robe products when the LEDWash 300 was launched.

“It was the first LED wash light that ever really worked properly, and Robe have gone from strength-to-strength in producing refined, beautiful and highly effective LED washes ever since, culmination with the Spiider” he declared.

He also made the most of the Spider's narrow beam capabilities on the Kensington show, and was very satisfied with how everything looked, especially the daylight sections.

He utilised seven BMFL Follow Spots – also a first for him using Robe's remote follow-spotting RoboSpot system.

Each was rigged with its own individual motion camera – operated via 7 x remote BaseStations which were all positioned at FOH, directly under the spots. The remote operators had control of pan, tilt and iris, and Michiel had all other parameters on a separate grandMA2 console, operated by Cedric Eestermans.

This new remote follow spotting technology from Robe is rapidly becoming popular, and Michiel commented that not having 7 people up in the air (operating the spots) was a neater and safer solution. Apart from that the BMFL follow spots blended seamlessly with all the onstage BMFLs and Spiders

In addition to these, he had another 11 conventional manually operated follow spots dotted around the room and over the stage.

The main stage lighting console was another grandMA2 operated by Dimi Theuwissen. With most of the show running to timecode from the band, Michiel called all 18 follow spots.

A grid of 160 spot moving lights in the centre behind the band, came in and out four times during the set, and there were also over 100 other wash lights on the rig plus 75 strobes.

Michiel really enjoyed the scope of working on a large show.

He praised promoter Friendly Fire under the direction of Marcel Buurman, and technical production manager Harold Opmeer from iTecca, for allowing a decent amount of time for the get-in, technical time and fine tuning on site. "It's seen a very positive and fertile collaboration between all departments, with a lot of trust between all

working for a spectacular common goal”.

The real creative challenge was getting a harmony between all the lighting and video sources for a one-off show. Nexxt Technology also commissioned and provided the video content, while the IMAG mix was live directed by United Multicam director, Johan Veerman.

The service and support from Phlipppo were “brilliant as always” says Michiel. Taking care of the account from the office / warehouse side was Sven de Boer and the Phlipppo lighting crew chief on site was Dennis Debrabandese. Phlipppo also provided Stijn Lauwereins who was dedicated to tech’ing the RoboSpot system, including training up seven local crew as operators ... which they picked up very quickly.

The show was exceptionally well-received and concluded this long and productive album cycle on a high note, giving Kensington the memorable send-off they wanted as they head back to the studio to focus on new recording work.
