free-to-attend sessions with expert speakers from the live events industry.

New additions to the Compact LED followspot range

Robert Juliat will be showing its brand new, comprehensive range of Compact LED followspots which includes the new **Berlioz**, **Tristan** and **Morgane** followspots. Uniquely, Tristan (7°-14° zoom) and Morgane (13°-24° zoom) are available as Cool White or Variable White models, the latter ranging from 3000K to 6300K. This allows the colour temperature to be adjusted directly from the console or via controllers, and eliminates the need for corrective filters on the front gel changer. The pair are the perfect replacements for RJ's former 1800W discharge series.

Tristan and **Morgane** also offer advanced new features that include, for the first time, a motorized iris which can be controlled remotely as well as locally. New mounting positions have been added to adapt photo-compatible accessories and, in particular, to integrate a remote display that provides real-time information such as beam size, iris size and beam position, as well as light intensity directly on a display with a direct view of the light.

The total compatibility of the Compact range with **SpotMe**, Robert Juliat's followspot tracking system, adds another essential dimension to the art of followspotting.

The Bizet family welcomes a World Premiere

Robert Juliat's Bizet family of fixtures will be strongly represented on the stand with white LED profile spots and Fresnels that can rival traditional 2000W fixtures.

Most excitingly, ISE will see the world premiere of a new innovation to the Bizet range: a **brand-new light engine comprising 8 LED colours** with deep red, red, amber, yellow, green, cyan, light blue and deep (royal) blue, with yellow being introduced for the first time.

This unique combination of eight colours makes it possible to achieve a very high performance spectrum with CRI values above 98, and uses additive colour mixing for perfect control of all colours.

Most significantly, the Bizet 8 LED colour Fresnels to be demonstrated in Barcelona integrate **RJ Color**, the well-established and innovative colour management engine originally developed for the Sully 4C. RJ Color is capable of managing all the data in real-time to offer a result as close as possible to the desired shade, whatever the console.
