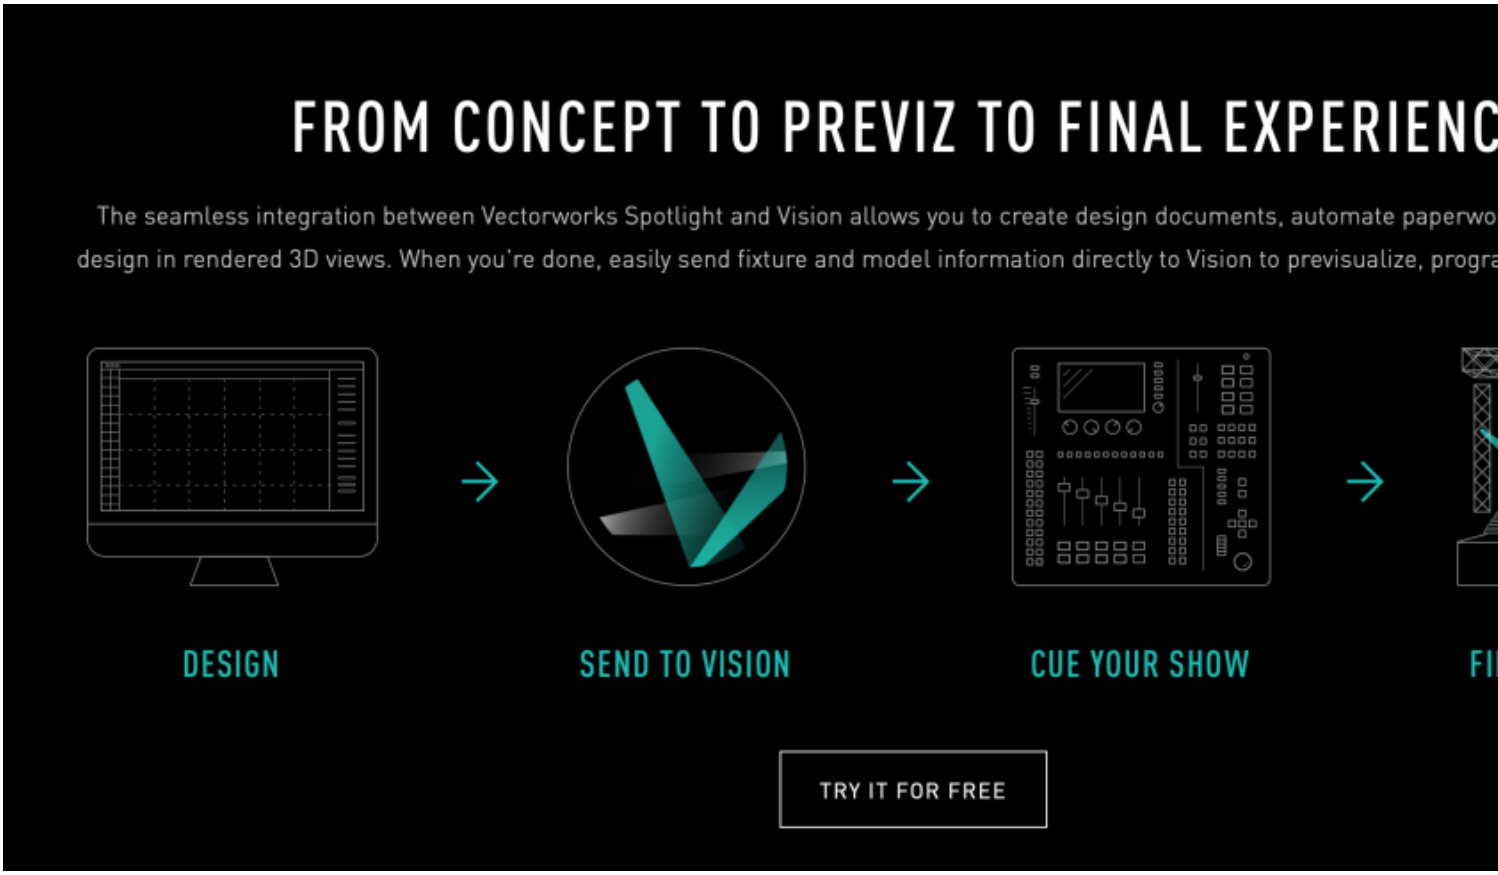
Vectorworks, from concept to Previz to final experience



The seamless integration between @Vectorworks Spotlight and Vision allows you to create design documents, automate paperwork, and visualize your design in rendered 3D views. When you're done, easily send fixture and model information directly to Vision to previsualize, program, and cue your show.

Vision puts the power to previsualize and cue your show at your fingertips. Available for both Mac and PC operating systems, this intuitive software works with your console and equips you to design creatively and efficiently. You will save time and money by previsualizing what your rig can do without needing to travel to the venue or having your crew stand by.
